

Academic Year 2025-26

CSEC3100D Final Year Project Module Handbook

Level 6, 30 ETCs – Full Time
De Montfort University, Dubai

Module Leader: Dr Atheer Al-Mousa
atheer.al-mousa@dmu.ac.uk

Version of 17 Sep 2025

This handbook is correct at the time of writing and may be subject to change. Throughout your studies, to ensure you have the most up to date information, you should always consult the online version of this handbook held on LearningZone.

TABLE OF CONTENTS

1. Welcome to the module	3
1.1. Contact details of all module teaching staff	3
2. Module specification	3
2.1. Learning outcomes (LOs)	4
2.2. Timeline (<i>Tentative</i>)	4
2.3. Assessments	5
2.4. Reassessment	5
3. Nature of Projects	6
4. Early documents of projects	6
4.1. Supervisor and Project Ideas Selection	7
4.2. Ethics Screening	7
4.3. Project contract	7
5. Deliverables	8
5.1. First Deliverable (25%)	8
5.2. Final Deliverable (75%)	9
5.2.1 RVS: Report, System and Viva (70%)	9
5.2.2 Management meetings (5%)	11
6. Use of LearningZone VLE and Turnitin	12
7. Academic Offences and the Academic Practice Officer	12
8. Module Specification	13

1. Welcome to the module

This module is quite likely to be the pinnacle of your undergraduate studies. One quarter of the time in your final year is allocated to it, in which you can work on a topic chosen in discussion between you and a supervisor. You can shape it and plan it to be the product of your studies that you will be most proud of. In job interviews, it can be a topic of discussion that makes you stand out in terms of enterprise and originality. With all this potential does come responsibility: *you* oversee your own progress on this. You have a project supervisor, supporting lectures, and general support from the module leader, but they cannot make you do the work: it is you who will need to plan, develop, and complete it. We are looking forward to yet another year in which our students take on imaginative topics, produce exciting reports and surprising technical artefacts such as software that stir our curiosity.

Please note that this is a **must-pass** module on BCS accredited programmes which means that the honours degree cannot be awarded with a project mark below 40%.

1.1. Contact details of all module teaching staff

- Dr. Atheer Al-Mousa
atheer.al-mousa
- **Project supervisors:** the academic staff in the School of Computer Science and Informatics from the provided list. Note that once you have a supervisor, you should be contacting them (rather than module leaders) in the first instance for any issues with your project.

2. Module specification

This is how the module is described in the university's teaching quality system, and most importantly it indicates what the module should achieve learning outcomes (LO). The main descriptions are given below.

Prerequisites: The project normally requires students to have successfully undertaken the requirements at level 5 and level 4 of their degree programme prior to commencing the project. The prior learning for each project, however, is dependent on the nature of that project. It is expected that students will choose their project topics, based on their individual course's requirements and with reference to their own prior learning.

The project provides students with the opportunity to carry out a significant piece of work involving critical analysis and reflection to provide an effective solution to a given technical and/or research-based problem. It enables students to apply and integrate previous material covered on the student's course as well as to extend the work covered on the course through research and self-learning. Students will be expected to demonstrate appropriate and proactive project management and written/verbal presentation skills throughout the period of the project. As well as analysing, designing, delivering, and appraising a product of suitable quality, they will be

expected to undertake, research, analyse, design, evaluate and report on some aspects of a subject explicitly allied to the project.

Some courses may have mandatory requirements that restrict the nature of project work to satisfy, for example, course validation conditions and/or the requirements of professional bodies such as the British Computer Society (BCS). As stated above, this module is a **must-pass** on BCS accredited programmes which means that the honours degree cannot be awarded with a project mark below 40%. Also, you are encouraged to use open-source libraries and version control during the development.

2.1. Learning outcomes (LOs)

- Apply theoretical and practical concepts from the programme of study to the construction of a solution to a practical problem. (First and Final)
- Carry out research and analysis to support the project requirements. (First)
- Plan and self-manage the work. (First and Final)
- Assess the potential global impact of the work (First)
- Present the work using a report in which the process and product are described, analysed, and critically evaluated. (Final)
- Present and defend the work in a formal demonstration/Viva (Final)

2.2. Timeline (*Tentative*)

This includes deadline days both for the students and supervisors, as well as the timing of lectures supporting aspects of project work and deliverables.

	Weeks	Session	Date	Day	Time	Location
BLOCK 1	Week 1	Module Shell Availability and Logistics				
	Week 1	Introduction to the Module	29 September 2025	Monday	9am-10am	BI0.05
	Week 2	Lecture: Mind mapping and project management (Bev Hancock-Smith)	06 October 2025	Monday	9am-10am	BI0.05
	Week 3	Inform ML about supervisor agreement with proof	18 October 2025	Friday	12pm (Noon)	
	Week 7	Submit your Supervisor name and Project Idea	14 November 2025	Friday	12pm (Noon)	
	Week 11	WorkTribe application (related to ethics screening and may not be applicable to all projects)	12 December 2025	Friday	12pm (Noon)	
BLOCK 2	Week 10	Lecture: Information searching and referencing (Charlotte Peeters)	01 December 2025	Monday	9am-10am	BI0.05
	Week 11	Submission of Signed Start Forms	12 December 2025	Friday	12pm (Noon)	
BLOCK 3	Week 20	Lecture: Writing a literature review (Bev Hancock-Smith)	09 February 2026	Monday	9am-10am	BI0.05
	Week 26	First Deliverable Submission	27 March 2026	Friday	12pm (Noon)	
BLOCK 4	Week 26	Lecture: Critical writing (Charlotte Peeters)	23 March 2026	Monday	9am-10am	BI0.05
	Week 27	Deferred First deliverable Submission deadline (applicable to students with deferral for the first deliverable)	04 April 2026	Friday	12pm (Noon)	
	Week 31	Final Deadline for Feedback to your 25% submission (For Supervisors)	01 May 2026	Thursday		
	Week 33	Lecture: Presentation skills for viva (Bev Hancock-Smith)	11 May 2026	Monday	9am-10am	BI0.05
	Week 36	Final deliverable Submission: Report + Code + System	05 June 2026	Friday	12pm (Noon)	
	Week 37-39	Demonstration (Vivas) Weeks				
	Week 45	Resit or deferred final deliverable (applicable to students with deferral for the final deliverable)	04 August 2026			

2.3. Assessments

The module mark is made up of *two* components:

- **First Deliverable (25%)**
- **Final Deliverable (75%): Report + Viva + System (70%) & Meeting Notes (5%)**

where each of those elements contribute towards your final mark. Each project submission will be assessed holistically on specific criteria which cover the report, the product, the management, and the demonstration. There are several means by which evidence for assessing project work may be gathered including but not limited to:

- Attendance at supervisory meetings and the outcomes of these meetings
- The written deliverable submissions, in the manner as detailed in the current student project handbook
- Demonstration (Viva)

An appropriate marking scheme will be available on the module LearningZone shell.

The project demonstration (Viva) is compulsory, and non-attendance will normally result in a mark of zero for the project.

All of these will be marked by the supervisor, and then second marked by a second marker (who also attends the Viva). Because of the nature of this work, marking cannot be anonymous.

2.4. Reassessment

Reassessment normally involves one of two processes:

- 1) If the **ratified** project mark is below 30%, by undertaking a new project during the following assessment cycle.
- 2) If the **ratified** project mark is between 30% and 39%, and subject to any recommendations from the project supervisor and/or module leader and/or the assessment board, an amendment to or enhancement of the existing work may be specified to be undertaken within the following reassessment period.

Please note that in the first case whereby the student is required to undergo the entire project activity/assessment cycle with reference to a new project, this is a resit with attendance, which incurs a module fee that (the exact amount can be confirmed by the course administrator).

3. Nature of Projects

This module is for “Cyber Security” and “Computer Science” students on a BCS accredited course. Hence, students need to make sure that the correct elements of a development process as indicated in the BCS checklist have been met in their projects.

For your final year project, you need to remember that most people involved in your project’s assessment (other than your supervisor) will only have your deliverables available to base their marks on, so having a full set of supporting documentation is crucial.

Your final project must be directly related to the field of Cyber Security, addressing a specific challenge or area of interest within the domain. Specifically, your project should contribute meaningfully to the evolving landscape of cyber security. A development project aims to produce a tangible technical artefact, such as a piece of software or a cyber security tool. While the primary focus is on development, significant research is also required to gain a deeper understanding of the application area and justify your choice among various technologies and methodologies. This may involve selecting from a wide range of technologies and concepts specific to Cyber Security, such as penetration testing, phishing, malware analysis, social engineering, cryptography, ransomware prevention, firewall and intrusion detection systems, zero-day exploit mitigation, threat intelligence, secure software development lifecycle (SDLC), and cloud security. You may also explore advanced fields such as AI-driven security systems, cyber-physical systems security, privacy-enhancing technologies, vulnerability assessment, digital forensics, network security protocols, cyber warfare and terrorism, ethical hacking, and security in critical infrastructure (such as SCADA systems).

The research phase will guide you in making well-justified decisions between alternative technologies, frameworks, libraries, programming languages, APIs, development models, and design patterns, ensuring that your solution is robust and applicable in a real-world cyber security context. Your final deliverable should address a pressing security challenge, demonstrating both practical and theoretical expertise in Cyber Security.

You may need to focus more on research than development, or vice versa, depending on the project. However, you are expected to create a proof-of-concept technical artefact, such as software, to illustrate or further explore your research area. Therefore, the project cannot remain entirely theoretical. Experimental projects could be acceptable students, provided that clear research questions are defined. Experimental methods should be outlined to answer these questions, and testing must be conducted to validate the experimental results.

4. Early documents of projects

Students are required to submit project start forms by **12 Dec 2025 at 12:00 noon**. These are project contract and ethics screening. Both must be signed and approved

by the supervisor and then uploaded (by student) to the MS Forms (link available on LearningZone).

4.1. Supervisor and Project Ideas Selection

You are required to select a supervisor and a project idea by **Nov 14, 2025, at 12:00 noon**. You must also have at least one meeting with your supervisor before making this selection.

4.2. Ethics Screening

Students need to fill out the screening ethics form first. Based on the outcome of it, an ethical approval may be needed. Please refer to the student's cartridge for screening questions. The deadline for ethics screening is **12 Dec 2025 at 12:00 noon**.

4.3. Project contract

Your first deliverable is the Project Contract (also known as 'Terms of Reference') which must be submitted by **Friday, Dec 12, 2025, at 12:00 noon**.

Students should consult the **BCS** checklist before completing their project contract, as it includes eight conditions that the project contract should fulfil, such as

- The contract contains an elucidation of the problem, the objectives of the project and a risk analysis.
- The contract states that the project will include an in-depth investigation of the context and literature, and where appropriate, other equivalent products.
- The contract states that the final report will contain a clear description of the stages of the life cycle undertaken.
- The contract states that the final report will contain a description of how verification and validation were applied.
- The contract states that the report will contain a description of the use of tools to support the development process.
- The contract states that the final report will contain a critical appraisal of the project, indicating the rationale for any design/implementation decisions, lessons learnt during the project, and evaluation (with hindsight) of the project outcome and the process of its production (including a review of the plan and any deviations from it).
- The contract states that there will be a description of any research hypothesis.
- The contract states that all research will be fully referenced.

This forms a 'contract' between you, your supervisor, and your proposer (if different from the supervisor). It states what you intend to do: what is the background to and scope of your project, and what are its aims and objectives. It provides a 'yardstick' against which your achievements at the end of the project can be assessed.

It is not easy to complete a suitable Project Contract; you will need to discuss it with your supervisor and may have to prepare several versions before it is finalised. More

information about the content of the Project Contract can be found in the Appendix and on the module LearningZone shell.

The Project Contract must be signed and dated by you and your supervisor. Keep the signed copy carefully. If a change in circumstances means that modifications must be made to your Project Contract during the year, these should be agreed with your supervisor and proposer (where different from the supervisor) and carefully documented.

Project plan is usually in the form of your product and sprint backlogs. To complete the plan, you will need to:

- Identify the tasks you intend to undertake and their order, remembering that some tasks can be undertaken in parallel.
- Allocate time for each task to be carried out.

You are likely to find it difficult to allocate time to each task, as you may not know what a realistic amount of time is. But you could work backwards from the deadline for project report hand-in, all tasks will need to be completed by then. You may find it helpful to do a critical path analysis. Allow some contingency for falling behind (you might get sick or have some delays). Your supervisor will advise whether your initial plan looks realistic. You may use a Scrum framework in your project. As you progress through your project you will need to update your plan for each meeting with your supervisor. Use it to indicate what progress you have made by showing which tasks are complete and which are ongoing. Take it to every supervision meeting. MS Project is available in all labs of Gateway House. Please seek advice from ITMS on how to use this at home. Remember that you start writing up on day one, you accumulate documents throughout the project period and the final stage should ideally be a matter of tidying up and writing your introduction, conclusions, evaluation etc.

Finally, as a student of DMU you will be aware of the high value placed on gaining an international experience through all the courses that we offer. As part of the process of enhancing your learning experience through global engagement, the international element of our undergraduate courses is now being assessed at every level. In the School of Computer Science and Informatics, the module which holds this assessment in the final year is the project module, which provides a natural forum for considering the wider aspects of your learning and demonstrable knowledge.

5. Deliverables

Make sure to submit your deliverables by the deadline.

Also note that if your submission is successful, Turnitin will give you a submission ID. Make sure you click on the 'confirm' button. After this you should receive a confirmation email about your submission. **If you do not receive the email, that means you have not submitted, and you must go through the submission process again.**

5.1. First Deliverable (25%)

This includes:

- a Literature Review minimum 1800 and maximum 2500 words (first row in Figure 1)

- the Requirements for the technical artefact such as software you are building (rows 2,3 and 4 in Figure 1).
- the status of the project according to the submitted product and sprint backlogs (row 5 in Figure 1).

Turnitin submission links will be provided for all these documents; students must compile all into one single word or pdf file for submission. The timing of the deadline for the First Deliverable is such that you will receive a mark and constructive feedback on it. Students should mark their action plans as completed, ongoing and not started. Supervisors also need to declare the status of their supervisee's projects as red, amber, and green. Figure 1 shows the first deliverable rubric. Please refer to the rubric below as well as the rubric in the module information for more details.

First deliverable (25%)	
Literature review (min 1800 and max 2500 words excluding reference list) (20%)	Acknowledgements, length, spelling, grammar, written style, table of contents, page numbers, referencing etc.
Functional requirements (no page or word limit) (20%)	Typically identify system users and write use cases or equivalent
Indicative test plan (20%)	1 page discussing the strategy and 2 pages of actual tests, e.g. test cases
System design documentation (20%)	3 pages (indicative) e.g. ERD, UML, System architecture, UI design, etc
Implementation report (min 500 and max 750 words) (20%)	What the prototype demonstration includes e.g. front-end, back-end, etc, and then must show this to your supervisor during 1st meeting of term 2)

Figure 1. First deliverable rubric descriptors (A copy of this can be found in student's cartridge)

5.2. Final Deliverable (75%)

Final deliverable has two segments: 70% for **Report + System (code) + Viva (RVS)** and 5% for meeting notes.

5.2.1 RVS: Report, System and Viva (70%)

By the time you submit the Final Deliverable, you should also have agreed a date for the project viva, which should include a demonstration of the technical artefact such as software you produced.

On the Final Deliverable deadline day, you should submit electronically:

- A final report between 7000 to 10000 words with 3 pages for references (please bear in mind that to maintain the quality of your report, it is vital to keep the appendices short, informative, and relevant. You can also create some other documents (for example questionnaires, all test cases, etc), put them in OneDrive folder, share them with your supervisor and then cite them accordingly in your report.)
- Your report may include
 - Use Case Diagrams/Use Case Descriptions/Class diagrams/ER model/State transition diagrams
 - Story boards/Interface Designs
 - Design Documentation
 - A Test Plan
 - Critical evaluation of your product and your design choices
 - Appendices (e.g., further design documentation, test logs, RAG status of each phase/month, etc)
- The technical artefact such as software

Detailed submission instructions (file types, how to submit files that are not checked by Turnitin, etc) will appear on the LearningZone shell well before the deadline day. Please refer to the rubric below as well as the rubric in the module information for more details. Both rubrics are available in the module shell. Figure 2 shows the RVS rubric.

As stated before, the viva/demo is compulsory for the development project. Viva/demo is virtual via Skype, MS Teams, Zoom, or any other platform. After you submit the final report, you will be assigned a 2nd marker. Your supervisor and 2nd marker will attend the viva/demo. Students are required to agree a date and time with both markers. **Not attending the viva** will result in the **failure** of the module. As shown in Figure 2, viva/demo contributes 15% to the RVS (70%) or 10.5% of your module mark but it is **compulsory**. Viva/demo should last maximum of **30 minutes** including presentation slides (if any), the technical artefact such as software /system/experiment demonstration, and QA. Please leave at least **10 minutes** for QA. Finally, 5% of your final deliverable mark have been dedicated to management meetings. Please see next section.

Report+Viva+System (RVS) 70%	Weight	Description
Main report (25%) Word count starts from first page to the last page of your report (pdf or word document) submitted to Turnitin (Title to the last sentence in appendix excluding reference list (see next)) Max 3-page single column for reference list. This is excluded from word count. Min word counts 7000 Max word counts 10000	Presentation (5%)	Acknowledgements, length, spelling, grammar, written style, table of contents, page numbers, referencing etc.
	Description of each of the major components (10%)	Clear explanation of the problem and objectives. Clear explanation of each of the major aspects of the product including a rationale for each of the design and implementation decisions.
	Description of the development lifecycle (5%)	Clear evidence of the application of an appropriate software development methodology. Discussion of each of the major stages including how validation and verification were applied at each stage.
	Critical analysis and reflection (5%)	What went wrong and what was right? What could be done differently next time? Appraisal of the product; analysis of approach taken (with hindsight); analysis of software/tools used.
*Viva (15%) Viva is mandatory. Students without Viva will receive 0% marks for their final submission out of 75%. *Mandatory	Timing, delivery and system coverage (10%)	Professional demonstration filled the available time appropriately with time for questions. All-important use cases covered
	Question handling (5%)	The student can defend the system
The System (40%) You must show the examiners your developed software/demo plus pieces of codes that you have written.	Product (30%)	The product meets the objectives of the agreed project contract (completeness) and the requirements for FYP
	Robustness and usability (10%)	Usability, robustness, and correctness.
Floating Mark (20%) The specifics should be agreed with your supervisor after receiving the mark and feedback for your first deliverable.	This is to adjust projects where students code more or research more. This item must be agreed with the supervisor.	Choose only one from these 3 options: - All 20% for the 4 report elements as stated above - All 20% for the 2 development elements as stated above - 10% for 4 report elements and 10% for 2 development elements

Figure 2. RVS rubric descriptors (A copy of this can be found in student's cartridge)

5.2.2 Management meetings (5%)

Your supervisor has been allocated 5 hours for face-to-face or online supervision, with additional time for reading drafts, marking deliverables, and providing feedback on all of those. To get the most out of supervision sessions, we suggest that before every supervision session, you

- Produce a summary of your progress since the last meeting: the work you have completed, the problems you have encountered and how you propose to solve them, etc. This should be documented on a meeting note (available in the student's cartridge on the LearningZone shell)
- Prepare a list of questions that you want to ask your supervisor, or issues about which you need some advice/guidance.
- Prepare a list of tasks you intend to work on between this and the next supervision meeting.

and during the supervision session, you

- Make sure you are clear about any feedback and advice you are given. Ask for clarification and consider taking notes.

- Agree with your supervisor the work you plan to tackle next.
- Agree the date of the next supervision meeting or how contact will be made to agree the next meeting.

and after the supervision session, you

- Revise your project plan, if necessary.
- Plan your time until the next supervision meeting, considering your other commitments.
- Put in 10 hours per week work on your project, more if you have fallen behind.

You **MUST** upload **10 high** quality meeting notes approved and signed by the supervisor to the **MS Forms** link in the module shell. This weighting is proportional, for example, if you upload 8 then you will get 4%.

6. Use of LearningZone VLE and Turnitin

All essential information for the module is included in this module handbook, which is also available on LearningZone. Students should check their email regularly, and the LearningZone shell for the module, for any relevant announcements. The LearningZone shell also includes several useful documents, such as

- The module specification
- All the module forms that you will need to complete throughout the year
- Marking grids for the first and second coursework component, per project type
- slides of the lectures supporting this module
- Advice provided by CLaSS for various of the activities and products in the module
- Suggested reading lists
- Advice to support you on making the most out of your supervisor, advice on the viva examination, and more.

All deliverables for the module should be submitted via Turnitin links provided. As per the DMU assessment policy, there is a university requirement for written coursework to be checked for originality using Turnitin where this is appropriate to the learning outcomes and assessment design. This includes both dissertations and major projects.

7. Academic Offences and the Academic Practice Officer

You are reminded that the work you submit must be your own, except where its original author is clearly referenced. Please refer to **Chapter 4** of the **General Regulations and Procedures Affecting Students**: <http://www.dmu.ac.uk/dmu-students/the-student-gateway/academic-support-office/student-regulations.aspx> for a broader and more detailed description of good standards of academic practice, including a discussion of what does and does not constitute plagiarism. Please contact your

supervisor or the module leaders if you remain uncertain about a specific issue related to this after reading the official guidance.

The faculty has a team of Academic Practice Officers who can be contacted via their support team at CEM (Computing, Engineering and Media) Academic Practice cemacademic.practice@dmu.ac.uk.

Module Description:

The project provides students with the opportunity to carry out a significant piece of work that reflects the aims and outcomes of their specific programme. It provides students with the opportunity to demonstrate practical and analytical skills present in their programme of study; to work innovatively and creatively; to synthesise information, ideas, and practices to provide a quality solution, together with an evaluation of that solution. The project should meet some real need in a wider context. Students will demonstrate an ability to self-manage a significant piece of work and will undertake a self-evaluation of the process. Students will be expected to demonstrate appropriate and proactive project management and written/verbal presentation skills throughout the period of the project. As well as analysing, designing, delivering and appraising a product of suitable quality, they will be expected to undertake research, analysis, design, implementation, verification, evaluation and reporting pertinent to the project. Indicative Content: The range of projects will be wide. Projects are obtained from a variety of sources including internal academic proposals, external organisation suggestions, and a number from students themselves. The deliverables will include:

1. A main report which will include:

- elucidation of the problem and the objectives of the project
- an in-depth investigation of the context and literature, and where appropriate, other similar products
- where appropriate, a clear description of the stages of the life cycle undertaken
- where appropriate, a description of how verification and validation were applied at these stages
- where appropriate, a description of the use of tools to support the development process
- a critical appraisal of the project, indicating the rationale for any design / implementation decisions, lessons learnt during the project, and evaluation (with hindsight) of the project outcome and the process of its production (including a review of the plan and any deviations from it)
- a description of any research hypothesis references

2. A set of appendices that are referred to within the main report, and which contain the substantive work on the project, including product deliverables, such as

requirements and design specifications and other project documents (project contract, informed consent, ethics review form etc.).

3. A product demonstration shortly after the submission of the main report

Learning Outcomes:

1. Apply theoretical and practical concepts from the programme of study to the construction of a solution to a practical problem. (Initial and Final Submissions)
2. Carry out research and analysis to support the project requirements. (Initial Submission)
3. Plan and self-manage the work. (Initial and Final Submissions)
4. Assess the potential global impact of the work. (Initial Submission)
5. Present the work using a report in which the process and product are described, analysed, and critically evaluated. (Final Submission)
6. Present and defend the work in a formal demonstration (Final Submission)

Evaluation:

Assessment	Unit Of		Individ'n	Minimum	Essential	Anon. Marking
	Duration	Duration	Weighti	Threshold	Component	Code
Initial Submission			25			OPTO1
Final Submission			75			OPTO1

Anonymous marking exemption codes: OPTO1: Individually distinct work; OPTO2: Reflection on development of own work; OPTO3: Presentation; OPTO4: individually negotiated work; OPTO5: work placement/experience/assessment

Assessment Notes:

Each project submission will be assessed holistically on specific criteria which cover the report, the product, the management, and the demonstration. There are several means by which evidence for assessing project work may be gathered including but not limited to Attendance at supervisory meetings and the outcomes of these meetings. The written deliverable submissions, in the manner as detailed in the current student project handbook Demonstration. An appropriate marking scheme will be available on the module LearningZone shell. The project demonstration is compulsory, and nonattendance will normally result in a mark of zero for the project.

Reassessment:

Reassessment normally involves one of two processes: 1) If the ratified project mark is below 30%, by undertaking a new project during the following assessment cycle; 2) If the ratified project mark is between 30% and 39%, and subject to any recommendations from the project supervisor and/or module leader and/or the

assessment board, an amendment to or enhancement of the existing work may be specified to be undertaken within the following reassessment period.

Expected Methods of Delivery:

The project is primarily self-directed with guidance and support from an assigned supervisor. Project skills sessions will normally be provided to give students the necessary pre-requisite knowledge and skills for the project that are not covered elsewhere in the taught programme. A project LearningZone shell is available as a resource for students, which contains all the necessary project documents/forms, the project calendar, project guidance notes, the list of available projects and supervisor allocations, deadline information, lecture notes etc. A demonstration is given by the student to their supervisor and second reader towards the end of the module. This enables students to show their understanding of the findings of their work, and to defend what they have done and how they have done it. Expected deliverable documents are as follows:

- Selecting one topic and being assigned one supervisor.
- Submitting the project contract (project plan/summary and a brief description about the project) and ethical review form.
- First deliverable (literature review) which is the initial submission.
- Final deliverable which is the final submission.
